

DigiSimpler

DigiSimpler is a simple and intuitive virtual sampler that allows you to quickly grab a sound file and start playing.

1 Help and Presets: in this section the user can store and load all instrument parameters. The button '?' will open the clue window, displaying extra information whenever the user hovers the mouse over any button interface.

2 Input: DigiSimpler can be played with your computer's keyboard and mouse or alternatively through a dedicated MIDI input device, which the user can select in this section.

3 Synth parameters and options: here the user can configure sound synthesis parameters, as well as accessing some other synth options, like the total number of voices used for polyphony. There is also a dedicated area to which the user can drag an audio sample (WAV/AIFF), loading it to the sampler.

4 Audio: in this section you can turn audio processing on/off, set the master output volume and access the audio preferences pane, where it is possible to define options like the sound card to use or the sampling rate value.
